Patients' experiences of lung cancer

Insights from Ireland

Introduction

The Global Lung Cancer Coalition (GLCC), an alliance of 41 patient organisations from 29 countries across the world, wanted to understand the challenges patients are currently facing to inform its patient advocacy work and the work of its member organisations.

In March 2024, the GLCC commissioned Censuswide to conduct a survey of lung cancer patients.

The survey received **905 responses** from patients across **18 countries**. For more information about the global findings, please visit www.lungcancercoalition.org/surveys.

Key findings from Ireland

Demographics

50

lung cancer patients responded

82% identified as male;18% as female

36% had non-small cell lung cancer

94%

were diagnosed in the last **five years**

Experiences of biomarker testing

89% of eligible respondents had been spoken to about biomarker testing

12% did not
understand
what biomarker
testing was when
they were first
spoken to about it

These results suggest a need for increased and improved communication around the topic of biomarker testing.

Support preferences in coping with lung cancer

72% get help from
healthcare professionals; 48% from
online support groups;
38% from family and
friends

38% would like to
get help through
counselling/therapy,
compared to 30%
reporting getting help
that way

The respondents sought help from a variety of places. Their preferences largely matched where they were already getting help, except for a greater desire for counselling/therapy.

Involvement with treatment teams

94% of respondents said that they felt involved in decisions about their treatment and care

42% of respondents felt fully involved (compared to 24% in 2023), but 46% still wanted to be more involved

While patient involvement was high, treatment teams need to ensure patients have the opportunity to be involved in decision-making as much as they would like to be.

Preferred methods of receiving information

Throughout the patient journey, face-to-face interactions were preferred, except when respondents were worried about something (when telephone conversations were preferred)

Cancer support
hotlines were the most
popular format for
receiving information
(preferred by 34%),
followed by print
materials (22%)

Whilst the results indicate a preference for direct interaction when receiving information, it remains crucial that treatment teams understand and accommodate individual patient preferences.

Call to action

This year's Patient Experience Survey highlighted **encouraging trends, including improved involvement in treatment and care decisions** when compared to last year's results. The results, however, also showed that more needs to be done to ensure all patients feel as involved as they would like in decision-making, that treatment teams clearly communicate to patients on topics relevant to their condition, such as biomarker testing, and that patients can access the support options of their preference.

The GLCC is therefore calling for the **implementation of the rights set out in its Patient Charter in Ireland**, to ensure that all lung cancer patients have access to quality healthcare; informed self-determination, which includes involvement in decision-making; and physical and mental integrity.
